IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re Application of:
HEATH, *et al.*
Serial No.: 08/699,716
Filed: 27 August 1996
For: RECOMBINANT F1-V PLAGUE VACCINE

Art Unit: 1645
Examiner: Duffy, Patricia Ann
Atty. Dckt: 003/029/SAP

AFFIDAVIT OF GEORGE W. ANDERSON, JR.

1. I, George W. Anderson, Jr., an inventor of the above-referenced application and resident of Smithsburg, MD, declare the following:
2. My curriculum vitae is attached.
3. Arthur M. Friedlander, David G. Heath, Susan L. Welkos and I are joint inventors of the subject matter disclosed in the above-referenced application.
4. From **[redacted date which is before 13 March 1996]** to February 1998, I conducted research and development on a plague vaccine comprising a F1-V fusion protein as an immunogen as part of the Army Plague Vaccine Group.
5. Before about **[redacted date which is before 13 March 1996]**, I obtained alhydrogel F1-V partial preparations from David G. Heath.
6. In my laboratory notebook I usually referred to the F1-V partial as "F1-V".
7. On **[redacted date which is before 13 March 1996]**, I began mouse challenge studies with the F1-V partial preparations I obtained from David G. Heath. The experimental protocol for the challenge studies is provided in my notebook #3598 on page 123. See Exhibit GA1.
8. The results dated **[redacted date which is before 13 March 1996]** for the challenge studies using *Yersinia pestis* strain CO92, which is $F1^+$ strain, with mice immunized alhydrogel F1-V partial preparations and controls with are provided in my notebook #3598 on pages 125-126. See Exhibit GA2.
9. The results dated **[redacted date which is before 13 March 1996]** for the challenge studies using *Yersinia pestis* strain C12, which is $F1^-$ strain, with mice immunized with alhydrogel F1-V partial preparations and controls with are provided in my notebook #3598 on pages 127-130. See Exhibit GA3.
10. On **[redacted date which is before 13 March 1996]**, I wrote in my notebook #3598 on page 132, that the data on page 131 of my notebook and the mouse challenge studies are the first direct evidence that the F1-V fusion (F1-V partial) can induce an immune response to both F1 and V protein. David G. Heath witnessed this page and the results to which it references. See Exhibit GA4.
11. Exhibit AF3 (GA5) is an excerpt of my notebook #3598.
12. On **[redacted date which is before 13 March 1996]**, I gave David G. Heath the protocol for formulating the F1-V whole vaccine preparations for mouse challenge assays. See Exhibit

DH16 (GA6).

13. In my laboratory notebook, I usually referred to the F1-V whole as "F1-WV".

14. Before about **[redacted date which is before 13 March 1996]**, I obtained alhydrogel F1-V whole preparations from David G. Heath and began conducting the mouse challenge studies. See Exhibit GA7.

15. The results of the challenge studies dated **[redacted date which is before 13 March 1996]** using *Yersinia pestis* strain C12 or CO92 with mice immunized with alhydrogel F1-V partial preparations and controls are provided in my notebook #3739 on pages 60-63. The results show that F1-V whole confer a protective immune response against both F^+ and F^- *Yersinia pestis* strains. See Exhibit GA8.

16. From about **[redacted date which is before 13 March 1996]** to 27 August 1996, I conducted further experiments to determine the efficacy of the F1-V fusion proteins and to determine whether any refinements could be made, such as the following:

    a. On **[redacted date which is before 13 March 1996]**, I conducted a mouse challenge study examining the long term efficacy of F1-V whole which is documented in my notebook #3739, page 75. See Exhibit GA9. The results dated **[redacted date which is before 13 March 1996]** are provided in my notebook #3739, page 85. See Exhibit GA10.

    b. On **[redacted date which is before 13 March 1996]**, I conducted a mouse challenge study examining the range of Al concentration which maintains an adequate adjuvant response which is documented in my notebook #3739, page 88. See Exhibit GA11. The alhydrogel F1-V whole preparations were obtained from David G. Heath. I copied the notebook pages from David G. Heath's notebook and inserted in my notebook. See Exhibit GA12. The results dated **[redacted date which is before 13 March 1996]** are found in my notebook #3739, pages 104-107. See Exhibit GA13.

    c. Exhibit GA14 shows experimental data from my notebook #3739 which evidence that from **[redacted date which is before 13 March 1996]** to 23 February 1996, I conducted various mouse challenge studies with F1-V whole.

    d. On 3 April 1996, I obtained the results for ELISA assays of serum obtained from mice immunized with F1-V whole to determine if the sera still contained antibodies against F1 antigen and V antigen as evidenced in my notebook #3739, page 122. See Exhibit GA15.

    e. On about 15 May 1996, I conducted a study with mice vaccinated with different amounts of F1-V whole protein. The mice were challenged subcutaneously and by aerosol with Y. pestis, C092 or C12. See Exhibit GA16.

    f. On about 28 June 1996, I conducted a study with mice vaccinated with either F1-V whole or a mixture of F1 + V or Plague USP vaccine. The mice were challenged by aerosol with Y. pestis C092. See pages 134 and 137 of my notebook #3739, Exhibit GA17.

    g. On about 5 July 1996, I conducted a study with mice vaccinated with either F1-V whole or F1 + V or Plague USP vaccine. The mice were challenged

subcutaneously and by aerosol with Y. pestis, C092 or C12. See pages 135-136 of my notebook #3739, Exhibit GA18.

17. For all the challenge studies referenced herein, I obtained most of the *Yersinia pestis* strains C12 and CO92 from Susan L. Welkos.

18. On 15 February 1996, I presented the work summarized in David G. Heath's Abstract 17. See Exhibit DH19 (GA19).

19. I left the Army Plague Vaccine Group on 26 February 1998 when I retired from the U.S. Army.

20. I have reviewed and analyzed the Titball patent and the three priority documents, UK 9505059, UK 9518946, and UK 9524825, and PCT/GB96/00571.

21. It is my opinion that prior to 13 March 1996, the filing date of PCT/GB96/00571, the inventors of the Titball patent had not conceived and/or reduced to practice a plague vaccine comprising purified F1 antigen fused to all or part of V antigen as nowhere do UK 9505059, UK 9518946, and UK 9524825 disclose isolating or purifying a protein comprising F1 antigen fused to all or part of V antigen from the host cell and other cellular components and/or administering a purified protein comprising F1 antigen fused to all or part of V antigen to a subject.

    a. In fact, UK 9518946 is the first disclosure indicating a genetic vaccine or how a host organism may be transfected with DNA for F1 antigen and V antigen to result in a live vaccine, i.e. an attenuated host organism (such as Salmonella) which produces the antigen when administered to a subject.

    b. As described in UK 9518946, the genetic vaccine or the live vaccine is administered to a subject such that the protein/antigen of interest is then produced in the subject.

    c. UK 9518946 does not describe isolating the protein/antigen of interest from the host organism and purifying the protein/antigen of interest from other cellular components prior to administration to a subject.

    d. The genetic vaccine or live vaccine described in UK 9518946 is not a purified protein comprising F1 antigen fused to all or part of V antigen which is isolated and purified from cells and other cellular components as claimed in the above-referenced application.

22. I have reviewed and analyzed the experiments and data of the Army Plague Vaccine Group and it is my opinion that the Army Plague Vaccine Group:

    a. Conceived of a fusion protein comprising F1 antigen fused to part of V by at least **[redacted date which is before 13 March 1996]**.

    b. Conceived of a fusion protein comprising F1 antigen fused to all of V by at least **[redacted date which is before 13 March 1996]**.

    c. Conceived of and reduced to practice a purified fusion protein comprising F1 antigen fused to part of V by at least **[redacted date which is before 13 March 1996]**.

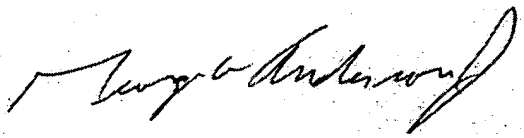
    d. Conceived of and reduced to practice a purified fusion protein comprising F1

antigen fused to all of V by at least **[redacted date which is before 13 March 1996]**.

e. Conceived of and reduced to practice a vaccine against plague comprising a purified fusion protein comprising F1 antigen fused to part of V by at least **[redacted date which is before 13 March 1996]**.

f. Conceived of and reduced to practice a vaccine against plague comprising a purified fusion protein comprising F1 antigen fused to all of V by at least **[redacted date which is before 13 March 1996]**.

23. I declare that all statements made herein of my own knowledge are believed to be true, and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under §1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.



Date: 14 March 2007

George W. Anderson, Jr.

PROFESSIONAL EXPERIENCE:

2004-Present	Senior Principal Engineer. Scientific responsibilities for the Operations and Sustainment of a Defense Threat Reduction sponsored multi-country epidemiological surveillance system and collaborative biological research program in the former Soviet Union.
2003-2004	Principal Advisor. Midwest Research Institute. General scientific guidance to the company and responsibilities for integrating the capabilities of various company divisions in projects. Continue participation in DTRA projects in the former Soviet Union (Kazakhstan, Uzbekistan and Republic of Georgia). Senior Program Manager. Department at Southern Research Institute was purchased by Midwest Research Institute. I continued program management of the work in the former Soviet Union until promoted to Principal Advisor.
1998-2003	Director, Medical Countermeasures Department. Southern Research Institute. Responsible for the management, direction, control and review of the departmental research and development programs. Established a Biological Safety Level-3 containment facility for vaccine potency testing of Department of Defense (DoD) Investigational New Product (IND) vaccines (VEE, WEE, EEE, Q fever, Tularemia) in Frederick, MD. Department provided the DoD with expertise in biological defense, biosecurity, biotechnology and

biosafety for DARPA and DTRA projects at former biological weapons facilities in the former Soviet Union (FSU). Some of the projects support Non-proliferation efforts. Projects in the FSU include on-site observations of laboratory work in BSL-2, -3 and BSL-4 containment laboratories. Worked as a consultant to the Department of the Army for the anthrax vaccine production facility in the United States. Conducted audits in BSL-3 laboratories. Immunized with most licensed and IND bio-defense vaccines. Biosafety consultant to U.S. laboratories. Technical spokes person on biosafety for dismantlement of a pilot production facility for biological warfare agents in the United States.

1998-1998 Principal Scientist, SRS Technologies. Perform and manage scientific and technical tasks requiring the assessment of chemical (CW) or biological warfare (BW) programs/capabilities of foreign countries for terrorist groups and the development of recommended measures to curb the proliferation of biological weapons and technologies.

1993-1998 Chief, Pathogenesis and Immunology Branch, U.S. Army Medical Research Institute of Infectious diseases (USAMRIID). Branch Chief responsible for directing research programs directed toward development and production of prophylactic and therapeutic modalities against bacterial diseases of potential biological warfare significance (e.g., anthrax, plague, Q fever, tularemia, glanders). Special project officer for multi-million dollar Good Laboratory Practices project which included facility upgrades, Responsible for the GLP BSL-3 laboratory setup, and project manager for multi-year preclinical project for a supplement to the anthrax vaccine license. Research associate on the clinical protocol for a supplement to the current anthrax vaccine license. Manage technical aspects of a contract for cGMP production of cell banks and recombinant *Bacillus anthracis* PA protein as diagnostic or vaccine component. Involved with nonproliferation activities with former Soviet weapons scientist. First US military officer invited into the BSL-3 containment laboratories at the State Research Center of Applied Microbiology; Obolensk, Russia.

1990-1993 Medical R&D Officer, Science and Technology Center-Europe, Frankfurt, Germany - Responsible for finding biotechnologies, products, and collaboration in Europe, the Middle East, Africa, and the former Soviet Union, which could shorten or negate the need for the R&D cycle in Defense Department laboratories. This work involved extensive travel to scientific conference and Institutes in these geographical areas and technical report writing.

1987-1990	Research Immunologist, U.S. Army Medical Research Institute of Infectious Diseases. Investigations included development of a congenic strain of rats, vaccine efficacy trials against an aerosol exposure, and pathogenesis studies on Rift Valley fever virus. These studies were carried out in a Biosafety Level 3 laboratory.
1983-1987	Graduate student at the Johns Hopkins University, while on active duty, US Army.
1977-1983	Research Scientist, U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), Fort Detrick, Frederick, Maryland - Was responsible for developing and investigating genetically define animal models for exotic viral and rickettsial diseases.

ACADEMIC APPOINTMENT: Associate Professor, Center for Disaster Preparedness, School of Medicine, University of Alabama

FIELD STUDIES:

1988	Member of a team of two who conducted an epidemiological sero-survey for phleboviral infections at the MRC Laboratory, The Gambia, and at the Institute Pasteur, Senegal, West Africa.

MILITARY SERVICE:

1977-1998	Retirement rank: LTC, U.S. Regular Army Commission, MSC Army Management Staff College, graduate Command and General Staff College, graduate

EDUCATION:

Ph.D., 1988	The Johns Hopkins University, Baltimore, Maryland, Viral Immunology. Dissertation: *Viral and Host Determinants of Resistance to Rift Valley Fever in a Rat Model*
M.S., 1977	Florida Institute of Technology, Melbourne, Florida, Biology.
B.S., 1975	Florida Institute of Technology, Melbourne, Florida, Biology.

TEACHING EXPERIENCE:

1996	Mentor, Department of Defense, Science & Engineering Apprentice Program

1989-1990	Served as a thesis committee member for a master's level candidate at Hood College, Frederick, Maryland. Supervised the candidate's research.
1988-1989	Sponsored a Korean ophthalmologist for the 1988-1989 ROK/US Scientist/Engineer Exchange Program in my laboratory to develop a model to study Rift Valley fever ocular sequelae.
1975-1977	Teaching assistantship at Florida Institute of Technology with primary teaching responsibilities for microbiology and biochemistry laboratories.

MEMBERSHIP IN ACADEMIC AND PROFESSIONAL SOCIETIES:

Membership: American Society for Microbiology
Sigma XI Scientific Research Society

HONORS AND AWARDS:

Who's Who Among Students in American Universities – 1974, 1975
Four-year Army ROTC Scholarship
Four-year U.S. Army Long Term Health, Education and Training Program (Ph.D. scholarship to the Johns Hopkins University)
Blue Key National Honor Fraternity
Sigma XI Scientific Research Society
Scouting: Highest rank – Eagle, Highest honor – Order of the Arrow, Vigil Member
U.S. Army Army Commendation Medal
Meritorious Service Award w/2 Oak leaf clusters
Legion of Merit
Distinguished Professional Achievement Award, Florida Institute of Technology 2002
Letter of appreciation from Joint Program Office for Biological Defense for assistance to BioPort Corporation in obtaining FDA approval for Biological License Agreement for anthrax vaccine

PATENTS:

U.S. Patent Number 5,320,069, "Small Animal Restraint Device"
Patent Pending Recombinant F1-V Plague Vaccine, filing #08/699,716 18 Dec 96

CONTINUING EDUCATION:

The Regulatory Process and Good Clinical Practices, Technology Management Integration, Inc., 1994

Regulatory Issues in Biotechnology, Univ. MD, 1995
Good Manufacturing Processes for Bioprocesses, Univ. MD, 1996
Quality Control and Quality Assurance of Biotechnology Products, Univ. MD, 1996
Assay Validation, PDA, 1996
Intro.to GLPs and Auditing, International Center for Health & Environmental Education, 1996
Writing and Evaluating Standard Operating Procedures for the Regulatory Environment, International Quality Training, 1996
Intro. FDA Good Laboratory Practices & Documentation Principles, International Quality Training, 1996
Good Laboratory Practices Regulations for Study Directors, International Quality Training, 1996
Fundamentals & Concepts of Calibration & Metrology, PDA, 1996
Biotechnology GMP Facility Design, Construction and Validation, Univ. MD, 1997
Advances in Filtration and Bioseparation Technologies, Pall Ultrafine Filtration Company, Columbia, MD, 1997
Validation of Biotechnology Processes and Systems, Univ. MD, 1997
Fermentation Microbiology, American Type Culture Collection Workshop, Rockville, MD, 1997
Fundamentals of D, F and Z Values, PDA, 1997
Basic Principles in Preparation of Sterile Dosage Forms, PDA, 1997
Parenteral Packaging: Rubber, Glass, Plastic and Metal Seals, PDA, 1997
Regulatory Compliance Training, Southern Research Institute, 1998
ISO 9001/Quality system Introductory Training, Southern Research Institute, 1998
Introductory to Earned Value Seminar, Dynport, LLC Professional Development, 1998
Positive Pressure Pneumatic BSL-4 Suite Training, State Research Center of Virology and Biotechnology, "Vector", Russia 2000
Introduction To Aerosol Mechanics I & II, AAAR, 2000
USA-Russia Workshop on International Research Ethics; Institutional Review Boards and Laboratory Animal Welfare, 2002
Introduction to Laboratory Ventilation and Design, American Biological Safety Association, 2002
Plant Biosafety, American Biological Safety Association, 2002
Bechtel Safety Leadership Workshop, Bechtel National Inc, 2006
The Transport of diagnostic & Infectious Samples, American Biological Safety Association, 2006
Biohazard Risk Assessment, American Biological Safety Association, 2006

Certifications:

Transport of diagnostic & Infectious Substances by Air (per ICAO Technical Instructions & IATA DGR) valid until 15 Oct 2008

REVIEWER/CONSULTANT:

U.S. Army In-house laboratory independent Research (ILIR) proposals, 1993-1998
U.S. Army Broad Agency Announcement proposals, 1993-1998
Experts Contact for database to assist Biological Arms Control Treaty Office (BACTO), 1997-1998
Nonproliferation Programs IntraAgency Roundtable, 1997-1998
U.S.-Uzbek Collaborative Biotechnology Grants Program, 2000
Consultant for DoD at BioPort Corporation (anthrax vaccine production facility), 2000-2002

File: F1-V fusion last update REDACTED
Protocol: B94-02
F1-V fusion protein immunization and challenge

Investigators: CPT Heath, Dr. Welkos, LTC Anderson, COL Friedlander

Background. CPT David Heath has produced and purified a recombinant F1-V fusion protein. The protein is positive by Western blot to F1 and V. Antigen dose will be based on 10 µg F1/dose + the amount of V which is fused to it. Subcutaneous injection at nape of neck.

V-antigen used in this experiment is from Mauro. Details of the V-antigen can be obtained from CPT Heath's notebook #_____ page _____.

Purpose: Immunize and challenge mice to check on immunogenicity and protection against the CO92 strain of Y. pestis by sc and aerosol challenge, **50 LD_{50}**.

EcF1c will be endotoxin free, same F1 as used in the active immunization experiment.

Alhydrogel, 1.3%, from SuperFos. Batch # 2043, Expiration date None, _____µg of AL/dose

Immunization Groups: 10 Swiss Webster female mice per group from Harlan Sprague Dawley

Groups **1-9**, the amount of F1 will be held constant.

		Strain	# Mice
Subcutaneous challenge			
Group 1	Alhydrogel alone, days 0, 30, sc	CO92	10
Group 2	alhydrogel + 10 µg F1, days 0, 30, sc	CO92	10
Group 3	alhydrogel + 10 µg F1 urea treated, days 0, 30, sc	CO92	10
Group 4	Alhydrogel + 18.5 µg F1-V fusion protein days 0, 30, sc	CO92	10
Aerosol challenge			
Group 5	Alhydrogel alone, days 0, 30, sc	CO92	10
Group 6	alhydrogel + 10 µg F1, days 0, 30, sc	CO92	10
Group 7	alhydrogel + 10 µg F1 urea treated, days 0, 30, sc	CO92	10
Group 8	Alhydrogel + 18.5 µg F1-V fusion protein, days 0, 30, sc	CO92	10
Group 9	Alhydrogel + 37.0 µg F1-V fusion protein days 0, 30, sc	CO92	10
		Total	90

Schedule

Groups 1-9

22NOV94	Arrival of Swiss Webster mice, female 7-8 wks, Harlan Sprague Dawley in AA-3 (Barrier)
01DEC94	Chipped with BioMedic Data Systems transponders in AA-3
16DEC94	1st immunization, AA-3
13JAN95	2nd Immunization, AA-3, day 28
17FEB95	Bleed to determine prechallenge titers, AA-3, day 63, serum#1500-1589
24FEB95	Challenge by aerosol & sc routes, day 70
24MAR95	Terminal bleed, day 28 pi, titrate spleens, serum # 2403 - 2453 Tissue # 9378 - 9432

Groups 10-23

29NOV94	Arrival of Swiss Webster mice, female 7-8 wks, Harland Sprague Dawley in AA-3 (Barrier)
13DEC94	Chipped with BioMedic Data Systems transponders in AA-3 (SGT Zimmerman, Vet Med)
22DEC94	1st immunization, AA-3; Crow & Fritzgerald helped
20JAN95	2nd immunization, AA-3, day 29
24FEB95	Bleed to dermine prechallenge titers, AA-3, day 64, serum# 1628 - 1678
3MAR95	Challenge by aerosol & sc route, day 71
31MAR95	Terminal bleed, day 28 pi, titrate spleens, serum # 2754 - 2800 Tissue # 9433 - 9479

Group 24

22DEC94	1st immunization, AA-3
06JAN95	Bleed, day 14, AA-3, SERUM# 1220-1229
20JAN95	Bleed, day 27, AA-3, SERUM# 1339-1348
20JAN95	2nd immunization, day 28, AA-3
24FEB95	Bleed, day 63, AA-3, SERUM# 1768-1778 and bronchial lavage #

Data on page 131 is the first direct evidence that the F1-V fusion protein can induce an immune response to both the F1 and V portion of the F1-V fusion protein. This is the first proof of the concept of making a fusion protein which could be used as an immunogen in a future plague vaccine. There was some non-specific reactivity toward V, but low levels compared to the F1-V treated animals.
The second part of the proof will be the protection studies started on REDACT and REDACTED If the protection studies work and the C092 challenge already shows protection, then the fusion protein which is unique could significantly reduce the complexities of the manufacturing process. F1-V forming an aggregate, may also increase the immunogenicity of V.

CFA appears to increase background problems. #1760 is so high it appears to be an error of some sort. Most probable, a tube contaminant or mislabeled tube.

Dear Dr Friedlander

CBDE/USAMRIID COLLABORATIVE RESEARCH INTO PROTECTIVE EFFICACY OF RECOMBINANT V-ANTIGEN AGAINST PARENTERAL AND AEROSOL CHALLENGE WITH YERSINIA PESTIS

As you are aware, CBDE has data to suggest that the V-antigen of the plague causing organism *Yersinia pestis*, when used as an immunogen, is highly protective against plague. The V-antigen could therefore be a major component of an improved plague vaccine to be developed in the future by CBDE.

You recently indicated to us that USAMRIID wished to collaborate in testing the protective capacity of the V-antigen against parenteral and aerosol challenge with virulent plague. We agreed that such a collaboration would be desirable because it could generate valuable data which would be of benefit to both CBDE and USAMRIID. We therefore decided that the collaboration should, in the future, be the subject of a Project Arrangement under the Memorandum of Understanding between the Secretary of Defense (US) and the Secretary of State for Defence (UK) concerning Technology Research and Development Projects (which is currently still under negotiation).

However, we also agreed that any delay in the collaboration would reduce the benefit of the resulting data, and therefore it would be desirable to commence work in advance of a more formal Project Arrangement.

Accordingly, this letter sets out below the respective duties, rights and responsibilities of each of us under the collaboration, *pro tem*, pending the negotiation of a more comprehensive arrangement:

1. SCOPE OF WORK

a. CBDE will supply to USAMRIID, for the purposes described in (b), the following:

i. 30 mg of recombinant *Yersinia pestis* V-antigen.

ii. Protocols detailing the immunisation route, doses and schedules used at CBDE.

iii. Polyclonal antisera raised against the V antigen of *Yersinia pestis*.

iv. Details of the CBDE challenge route, challenge strain and protection data afforded by the V-antigen vaccine against parenteral challenge with *Yersinia pestis*.

b. USAMRIID will:

i. Immunise groups of animals parenterally with the following:

- V-antigen in combination with Alhydrogel.

Suggested protocol for the F1-whole V fusion protein.

File: F1-wholeV fusion last update REDACTED
Protocol: B95-01
F1-WV fusion protein immunization and challenge

Investigators: CPT Heath, Dr. Welkos, LTC Anderson, COL Friedlander

Background. CPT David Heath produced and purified a recombinant F1-V fusion protein. The protein is positive by Western blot to F1 and V. Only part of the V-protein was used in the intial F1-V fusion. This F1-V fusion was immunogenic, but was not very efficacious when compared to the whole V-protein (WV) produced by Mauro to protect against F1 minus strains of *Y. pestis*. This is a repeat of part of the intital F1-V protection study using the whole V-protein in the F1-WV fusion. Subcutaneous injection along back of the mouse for immunization.

Purpose: Immunize and challenge mice to check on immunogenicity and protection against the CO92 and C12 strain of Y. pestis by sc and aerosol challenge, **100-Max LD_{50}**.

Alhydrogel, 1.3%, from SuperFos. Batch # 2043, Expiration date None, _____µg of AL/dose

Endotoxin level in the F1-WV preparation is _____ U/ml.

Will use **Mauro's V** which has been urea treated as per the F1-WV procedure. Details in CPT Heath's laboratory notebook.

Immunization Groups: 10 Swiss Webster female mice per group from Harlan Sprague Dawley

Implantable Micro Identification transponders from: BioMeic Data Systems, Inc 255 W. Spring Valley Ave. Maywod, NJ 07607, 1-800-526-BMDS

File: F1-V,longterm Last update: REDACTED
Protocol: B95-01
Investigators: Anderson/Heath/Welkos/Friedlander

Background: F1-WV and F1 and V in combination have been shown to protect against challenges of CO92 and C12 with a two dose schedule (0 and 30). The long-term decay of the antibody response to the initial immunization and length of protection from a single immunization is currently not known.

Purpose: To examine the decay of the antibody response to an initial immunization, protection afford over time to an initial immunization to indicate the optimum time for the 2nd immunization for an aerosol challenge. Titers to F1 and V will be determined. Mice will be challenged with **50-100 LD_{50} CO92,** aerosol challenge.

In the below challenge groups, when protection falls to zero, the remaining groups will be booster and challenged 2 weeks post-boost.

Immunogens: EcF1s, Mauro's V, and F1-WV all essentially endotoxin free from Dr. Heath.

Mice: Swiss Webster (Hsd:ND4) female mice per group from Harlan Sprague Dawley, Inc. Indianapolis, Indiana (317) 894-7521.

Alhydrogel: 1.3%, from SuperFos. Batch # 2043, Expiration date None, 0.1857 mg of AL/dose

IMI-1000, Implantable micro identification transponders, BioMedic Data Systems, Inc., 255 W. Spring Valley Ave. Maywood, NJ 07607, Tel 201 587-8300.

Exhibit GA11

File: Alhydrogel concentration
Last updated: REDACTED

Anderson/Heath/Welkos/Friedlander

Background. The allowable Al content in a human vaccine is 0.85 mg/dose as determined by assay (21 CFR 610.15(1)). However, the lowest possible dose of Al should be used which maintains an adequate adjuvant response with the EcF1c and V immunogens. A dose response for Alhydrogel has not been done with a combination of F1 and V. Therefore this experiment will examine a range of concentrations of AL which will be used with a constant amount of EcF1c and V. EcF1c (60 EU/ml) and V-His tag (preparation are essentially endotoxin free. The level of endotoxin in the thrombin treated V preparation without the His tag is 49 EU/ml.

Compare the antibody response to V with F1-WV protein with and without alhydrogel. When F1 + V is used to immunize without alhydrogel, there was not antibody response to V. This will be done with F1-WV in order to determine whether F1 is contributing anything to protection with the F1-WV protein. F1-WV purified by Ni++ and ran through a Sartorius Q15 filter using 10mMtris, ph 7.6, 0.5mM EDTA + 0.5 MNaCl for elution. See Heath's note of 5-6 Dec. Endotoxin ____ EU/ml.

Mice: Swiss Webster (Hsd:ND4) female mice from Harlan Sprague Dawley, Inc. Indianapolis, Indiana (317) 894-7521.

1.3% Alhydrogel (Aluminium Hydroxide Gel Adjuvant): Al_2O_3 (1.3%) equivalent to $Al(OH)_3$ (2.0%), from SuperFos Biosector a/s, Frydeniundsvej 30, DK-2950 Vedbaek, Denmark. Batch # 2043, Expiration date None: U.S. supplier - Accurate Chemical & Scientific Corp, 300 Shames Drive, Westbury, NY 11590, Tel (516) 333-2221, Fax (516) 997-4948.

Al = 13 O = 8 H = 1, $Al(OH)_3$ = 40 molecular weight

Current procedure for adsorption of F1 and V to Alhydrogel: 1.0ml Alhydrogel brought to 7.0 ml
2% $Al(OH)_3$ = 20 mg/ml
20mg/ml)(1.0ml) = (x)(7.0ml final volume) x = 2.857 mg $Al(OH)_3$/ml
(2.857mg/ml)(0.2ml dose) = 0.57142 mg $Al(OH)_3$
AL is 0.325% of $Al(OH)_3$
0.235% of 2.857mg = 0.1857 mg of AL/0.2ml dose which the mouse receives

Current dose of Al which has been used through out the mouse experiments is 0.1857mg. Try two other doses each 75% of the former GP1 = 0.1857mg (standard amount of AL), GP2 = 0.1393mg, GP3 = 0.1045mg

from USAMRIID protocol

Date	Procedure
09Nov95	Arrival of mice in B412 at 7-8 weeks of age
16Nov95	Chipped mice in B412, SGT Zimmerman/Plumtree
06Dec95	Day 0, immunization Anderson/Shamblin
12Jan96	Day37, bleed prior to challenge, serum # 8045-8254 PLUMTREE, ANDERSON, SHAMBLIN
19Jan96	Day44, challenge ANDERSON, LIVINGSTON IN ANIMAL ROOM, + BLUE 1ST 3 RUNS
15Feb96	Day 28 pi, terminal bleed, spleen removal
	serum # spleen #

SET UP ABSORPTIONS FOR LTC ANDERSON:

GRPS 000A + 000B used F1-V that had been purified by Ni^{2+} & run through a Sartorius Q15 filter using 10 mM Tris, pH 7.6 0.5 mM EDTA + 0.5 M NaCl for elution. Buffer exchanged this using 10 mM Tris, pH 7.6 + 0.5 mM EDTA using a centricon. Did BCA assay for protein conc = 690 ug/mL and 1.5 mL total volume

so used 450 ug in 3 mL PBS = 652 ul of F1V (@ 690 ug/mL)

652 ul F1-V + 2.348 mL PBS

GRPS 00A 00B same F1-V as above @ 690 ug/mL

add 652 ul of F1-V to 428 ul ALHYDROGEL & ABSORBED FOR 2 HR @ 4°C

- spun tube @ 2000 rpm for 5 min. & removed 2 100 ul aliquots to check for protein conc. on BCA assay (see BCA from results)

- added PBS to absorbed ALH-F1V to 3 mL

PS 0A + 0B Took F1 capsule extract @ 60 EU/mL & conc. of 705 ug/mL & added 496 ul of this to 1 mL ALHYDROGEL + 137 ul of thrombin treated Vaccine (5.1 mg/mL) = 49 EU/mL

this is for 10 ug/200 ul dose of F1 + 25 ug/200 ul dose V in a final volume of 7 mL

496 ul of F1 = 350 ug 137 ul V = 700 ug V

496 ul F1 + 137 ul thrombin V + 367 ul PBS + 1 mL ALHYDROGEL

REDACTED (cont)

GRPS 1A + 1B	10 mg FX + 20 mg hV in 7 mL final volume	hV = 1.3 EU/mL
	496 uL FI (705 mg/mL) + 129 uL hV (5.14 mg/mL) + 375 uL PBS	
	+ 1 mL ALHYDROGEL, Rock OV @ 4°C	
	- Spin 2000 rpm, 5 min: remove 2 x 100 uL aliquots for BCA Assay of absorption	
	- Then added PBS to 7 mL final volume	
GRPS 2A + 2B	same as 1A + 1B above but used 750 uL ALHYDROGEL + additional 250 uL PBS	
GRPS 3A + 3B	same as 1A + 1B above but used 562.5 uL ALHYDROGEL + 437.5 uL PBS to equal 1 mL then same as 1A + 1B	
GRP 4 + 5	added 1 mL ALHYDROGEL to 1 mL PBS + rocked OV. Then added PBS to 7 mL final volume	
GRPS 6	added 750 uL ALHYDRO + 250 uL PBS + 1 mL PBS + rocked OV @ 4°C. Then added PBS to 7 mL final volume.	
GRP 7	added 562.5 uL ALHYDROGEL + 437.5 uL PBS then 1 mL PBS + rocked OV @ 4°C	
	-added PBS to 7 mL final volume	
GRP 8+9	added 496 uL FI + 129 uL hV + 1.375 mL PBS + rocked OV. Then 100.1 PBS to 7 mL final volume	

BCA assay results:

BSA 1:10	.181	.187
1:20	.079	.086

Sartorius Q15 experiment

- had 5mL of FIV @ ~ 2mg/mL + did Q15 exp. as follows:

1) equilibrated Q15 w/ 15 mL 10mM Tris (pH 7.6), 0.5 mM EDTA,
2) APPLIED 4.5mL of FIV in 10mM Tris, 0.5 mM EDTA pH 7.6 to filter (collected "FLOW THROUGH")
3) WASHED Q15 w/ 10mL Tris-EDTA equilibration buffer + collected as "Wash"
4) eluted w/ 12mL Tris, EDTA + 100 mM NaCl & collected
5) " " " " " + 200 mM NaCl " "
6) " " " " " + 300 mM NaCl " "
7) " " " " " + 400 mM NaCl " "
8) " " " " " + 500 mM NaCl " "

1.0 mL of ... 0 ... 500 mM NaCl 10mM Tris pH 7.6 each (collected)

Ig Subclass ELISA response to vaccination with *Yersinia pestis* V and F1 antigens (continued)

Plate setup:

Same as 21 FEB 96, except test samples (6) for V antigen only.

Procedure:

Same as 21 FEB 96, except:

- Second antibodies (goat anti-mouse IgG1, IgG2a, and IgG2b) diluted 1:3000 (decreased from 1:2000).
- Conjugate dilution decreased to 1:3000 (from 1:2000).

Results: see separate pages.

For Animal Caretakers: Contact LTC Anderson, Office Ext 4933, Fax Ext 2152, Home (301) 473-5059 if you have any questions
Discard dead animals
Check chip number of dead mice with scanner
Mark number of animals alive in each cage
LOST after Chip # means the chip has fallen out

Parenteral challenge of mice with C092/M.S. and C12/M.S.

1. Streak 1 slant each with the Master Seed of C092 and C12.
   Incubate 2 days at room temperature.
2. Harvest by suspending in 4-5 mls of HIB.
3. Read OD620 of a 1/10 dilution.
4. Adjust to OD 1.0

7/5/96:
Adjusted ODs and read final ODs on 1/2 dilutions:
Final OD = **1.064**, for C092
" " - **1.10**, for C12

C092/M.S.:

1. Prepare dose
5.0 -7.5x10e2/ml:
   (1) Add 0.2 ml OD 1.0 to 1.8 mls HIB.
   (2) Add 0.2 ml (1) to 1.8 mls HIB.
   (3) Add 0.5 ml of (2) to 4.5 mls HIB.
   (4) Add 0.5 ml of (3) to 4.5 mls HIB.
   (5) Add 0.5 ml of (4) to 4.5 mls HIB.
   (6) Add 4.0 ml of (5) to 36 mls HIB - - Pipet 10 mls into each of 3 tubes:
   mice INOCULUM: 1 x 10e3/ml: ~200 cfu/dose

---

2. Plating: The sample will be diluted in HIB and plated on SBAP:

suspension	Conc./ID	dilution	Total No. no. plates	plates
mice Inoculum	5x10e2/ml	undil, 10-1	5 each	10

RESULTS:
7/5/96 doses: 1.4 x 10e3/ml, 280 **cfu/dose** (**140 LD50s**)

7/12/96 doses: 6.5 x 10e2/ml, 130 **cfu/dose** (**72 LD50s**)
7/18/96 doses: ____ x 10e2/ml, ____ **cfu/dose** (____ **LD50s**) - canceled

C12/M.S.:

1. Adjust slant suspension to OD620 = 1.0.
Prepare dose
2.3 x10e3/ml:

(1) Add 0.2 ml OD 1.0 to 1.8 mls HIB.
(2) Add 0.2 ml (1) to 1.8 mls HIB.
(3) Add 0.5 ml of (2) to 4.5 mls HIB.
(4) Add 0.5 ml of (3) to 4.5 mls HIB.
(5) Add 1.0 ml of (4) to 9.0 mls HIB.
(6) Add 6.0 ml of (5) to 18 mls HIB (1/4) - -

INOCULUM, C12-100 sc LD_{50}s (910 cfu). Pipet 10 mls into each of **2 tubes:**
1 x 10e3/ml: ~200 cfu/dose

---

2. Plating: The Inoculum will be diluted in HIB and plated on SBAP:

suspension	Conc./ID	dilution	no. plates	Total No. plates
C12 **Inoculum**	2.3x10e3/ml	undil.	5	
		10-1	5	
		10-2	5	TOTAL-15

RESULTS:

7/5/96 doses: 3.36 x 10e3/ml, **6.7 x 10e2 cfu/dose** (**73.6 LD50s**)
7/12/96 doses: 3.0 x 10e3/ml, **5.8 x 10e2 cfu/dose** (**63.7 LD50s**)
7/18/96 doses: ____ x 10e3/ml, **____ x 10e2 cfu/dose** (**____ LD50s**) – canceled

INTRODUCTION

AIBS was requested by US Army Medical Research and Development Command (USAMRDC) to convene a review Panel to provide an assessment of the scientific merit of the Medical Biological Defense Research Program (MBDRP) on Plague. It was requested that the three scientific reviewers have a collective knowledge of the following subject areas: *Yersinia pestis*, Vaccine Production, Molecular Genetics and FDA requirements for a vaccine. Such a panel was convened and provided with documentation by USAMRDC to read prior to the conference. This consisted of abstracts prepared by the individual investigators who form the MBDRP on Plague (see Appendix 1.)

CHARGE TO PANEL

Three scientific reviewers were asked to evaluate the MBDRP on Plague. They independently reviewed material provided by USAMRDC and attended a conference on the subject matter. They were asked to judge the scientific merits of the Program.

The reviewers, individually, provided comments to AIBS, who in turn compiled this written report summarizing these comments and the discussions at the conference. The Chairman of the Review Panel read and approved the report prior to its submission to USAMRDC.

PRESENTATION SUMMARIES

The conference comprised presentations by each of the following investigators. Abstracts were provided for by each and are attached as Appendix 1.

COL ARTHUR FRIEDLANDER
Overview of plague program

COL RUSSELL BYRNE
Antibiotic treatment of experimental pneumonic plague

DR. PATRICIA WORSHAM, DR. M. LOUISE PITT, LTC KELLY DAVIS
F1 is not a required virulence factor for the mouse or non-human primate

MAJ GERALD P. ANDREWS, LTC GEORGE J. ANDERSON, JR.
Protective efficacy of active immunization with purified F1 from *Yersinia pestis* and an *Escherichia coli* recombinant strain against lethal parenteral and respiratory plague challenge

DR. PATRICIA WORSHAM
Studies on the role of the pigmentation locus in the pathogenesis of *Y. pestis*

DR. SUSAN L. WELKOS, LTC KELLY J. DAVIS
Analysis of the role of pPst encoded genes in pathogenesis of infection by *Y. pestis*

DR. ALAN SAMPLE
Plasminogen activator protease degrades proinflammatory cytokines

MAJ GERALD P. ANDREWS, DR. SUSAN STRALEY, DR. ALAN SAMPLE, MAJ GERALD P. ANDREWS
Cloning, Expression, Purification, and Protective Efficacy of Yops and pH 6 antigen

LTC GEORGE J. ANDERSON, JR., DR. DAVID HEATH
Cloning, expression, and protective efficacy of V antigen

LTC GEORGE J. ANDERSON, JR.
Cloning, expression, and protective efficacy of F1-V fusion protein

DR. JEFFREY PULLEN
Determination of important B and T-lymphocyte epitopes in the F1 and V antigen proteins of *Yersinia pestis*

COL ARTHUR FRIEDLANDER
Overview of future plans

SUMMARY EVALUATIONS OF THE RESEARCH AREAS

The review panel read the abstracts provided by the investigators prior to the meeting on February 15, 1996, and listened to presentations by each of the investigators at the meeting. The following comments include recommendations to individual investigators, and are intended to be constructive. Certain points apply to more than one project, or even to the program as a whole, and hence may appear repetitive. Also, the reviewers recognize that some of their recommendations may be affected by programmatic decisions that are beyond the control of the immediate Program staff and thus may not prove to be possible.

COL ARTHUR FRIEDLANDER
Overview of plague program

The USAMRMC Plague Research Program's primary objective is to develop a vaccine that will protect military personnel if exposed to an aerosol attack of *Yersinia pestis*, the causative agent of plague. Given that the currently available vaccine (USP) protects primarily through anti-F1 antibody, that this vaccine offers very poor protection from primary pneumonic plague, and that $F1^-$ strains are highly virulent, there clearly is a need for a new, more protective vaccine. Once developed, the general population living in areas endemic for plague would also benefit from such a vaccine.

Most of the projects presented as separate studies and presentations clearly meet the program's primary objective. Part of the rationale for the approach taken is that an aerosol attack of *Yersinia pestis* might include strains that do not produce the F1 capsular antigen. Given that the current vaccine (USP) stimulates primarily antibodies

MEDICAL BIOLOGICAL DEFENSE RESEARCH PROGRAM
ON PLAGUE

TIME: February 15, 1996, 8.00am to 5.00 pm

LOCATION: US Army Medical Research Institute of Infectious Diseases, Conference Room, Fort Detrick, Frederick, MD

EXECUTIVE SUMMARY

Overall, the program has made very significant and impressive advances in only a few years towards the development of a new vaccine, and Dr. Friedlander and his entire team of investigators can be proud of their accomplishments to date. They clearly have a very viable, sound program with a good team of investigators that is focused with high potential to succeed. It is hoped that the administration will continue to support this effort and provide the group with the resources and time necessary to complete their task. The investigators clearly considered the recommendations of the previous reviewers and incorporated several of the suggestions into their program.

The team has invested significant effort in examining numerous virulence determinants of *Yersinia pestis* for their ability to stimulate protection through immunization. The F1 capsular antigen and the V antigen have been shown by investigators in other laboratories to be good candidates for inclusion in a new multivalent subunit vaccine. The team at USAMRMC has confirmed the protective value of these two antigens. However, realizing that F1 and V antigens might not be sufficient for full protection against all virulent strains of *Y. pestis*, the group has worked through an impressive list of additional candidates. The only other antigen that offered significant protection was YopD, although protection was only observed when mice were challenged with the $F1^-$ strain. Passive immunizations with anti-F1 and anti-YopM antisera deserve further attention. Combined antibiotic treatment and immunization might increase the survival of animals challenged by aerosol.

The team appears to make use of mice and nonhuman primates as excellent animal models for both their parenteral and aerosol challenge experiments. The current vaccine study protocols for test challenges are very good.

The development of *in vitro* correlates of immunity should be a high priority of the program. It is currently the weakest portion of the future plans. As discussed with the investigators, the assumption that protection is solely antibody-mediated has potential difficulties. Before continuing studies to map active B cell epitopes, the investigators need to determine the role of T cells in immunity to plague.

examined for *Y. pestis* in the LD50 studies and survivors were examined for clearance of the organisms to determine the full level of protection provided by vaccination.

In the first study, the V antigen was examined for its ability to generate a protective immune response in mice challenged by parenteral subcutaneous or aerosol challenge with either the $F1^+$ or $F1^-$ isogenic strains of *Y. pestis*. Recombinant V antigen was cloned and expressed in two fusion/expression systems and used with an adjuvant approved for human use (Alhydrogel). Both preparations of rV antigen were administered twice and provided very good protection in mice challenged by both routes and both strains. This is an excellent study and identifies (as another laboratory has demonstrated independently) the V antigen as an excellent candidate immunogen to include in a vaccine to protect from aerosol infections with either $F1^+$ or $F1^-$ strains. These studies are critical to the program's objective and provides some quite exciting results.

The second study extends the work on the V antigen of *Y. pestis* by examining protection following a single dose of 10 μg (the previous study used two immunizations prior to challenge). Mice were subsequently challenged by aerosol exposure to either low and high doses of the $F1^+$ or $F1^-$ strain. Protection ranged from 70% to 78% survival in these mice, demonstrating that a single immunization could afford significant protection from an aerosol route of infection. However, the schedule including a primary immunization followed by a single boost afforded 20% to 30% greater protection (previous report). While it is of interest what level of protection results from a single dose, future work with nonhuman primates will likely confirm what we know about many other bacterial vaccines, i.e., better protection results with boosts following the primary immunization.

Two areas need to be addressed in future work on the V antigen. The studies presented used the V antigen tagged with histidine from the pET vector. If this antigen is to be used in humans, a method for the efficient removal of the his-tag is needed. Identifying the active sites on the V antigen responsible for protective immunity as well as potential negative biological activities, such as immune suppression, may be required for this antigen to be safe. The group might also consider examining how long protective immunity lasts following vaccination with the V antigen. Some of these issues were addressed by Dr. Friedlander in his closing remarks.

LTC GEORGE J. ANDERSON, JR.
Cloning, expression, and protective efficacy of F1-V fusion protein (abstract 17)

Prior studies have confirmed the potential for both F1 and V antigen to protect mice from *Y. pestis* by both parenteral and aerosol routes. In this study a construct was made containing the F1 and V antigen genes for expression of a fusion protein. When the F1-V fusion protein was used for immunization, mice were protected when challenged by needle or aerosol with either the F1 positive or F1 negative strain of *Y. pestis*. Poorer protection resulted when only a portion of the V antigen was expressed as a fusion protein with F1. This work is quite clever and interesting, and advances the program's effort towards the development of a multivalent vaccine. The attempt to make fusions of these two antigens also demonstrates an advance towards reducing

the steps required for making and purifying antigens for the vaccine. The investigators are also testing longer term antibody responses and how long protection lasts (a concern raised from the previous studies with the V antigen alone). Antibody responses to the F1 and V antigen components of the fusion protein were also examined. Both F1 and the V antigen have been shown by other workers to be protective and now the group at USAMRMC has shown that rF1 and rV are the best candidates identified to date for a new plague vaccine.

Again, this fusion protein has a histidine tag, which will need to be removed prior to its use in humans.

DR. JEFFREY PULLEN
Determination of important B and T-lymphocyte epitopes in the F1 and V antigen proteins of *Yersinia pestis* (abstract 18)

This study attempts to identify important B and T cell epitopes within both the F1 and V antigens, however only B cells were addressed in the presentation. Identifying the functional epitopes in these proteins is important both to an understanding of the protective mechanisms stimulated by these two immunogens, and for assessing the potential of using synthetic peptides rather than entire recombinant proteins in a vaccine. This study is an important part of fulfilling the long-term objective of developing a useful vaccine. However, the usefulness of the current appproach should be carefully reconsidered.

The use of short peptides to generate antibodies without conjugation to carrier molecules has, in general, not been very successful. Although it is sometimes possible to generate antibodies against short peptides, it is unlikely that the response will be protective without some T cell involvement. The investigators' initial experiments showed that peptides generated from the region of the protein known to be antigenic failed to generate a protective response despite generating significant antibody production. These results should have alerted them to the problems inherent in this approach. Instead, the investigators expanded their studies in response to these findings by making and testing additional peptides covering the whole of V antigen and F1 protein. This was a lot of work, using a lot of mice, that generated very little useful information. A simpler and more direct approach to begin mapping the reactive epitopes in these immunogens is to screen the overlapping peptides *in vitro* using antisera from animals or humans that have either had infections with *Y. pestis* or been immunized with native F1 and/or V antigen. Another concern is that in the future goals, it was stated that the response to the peptides, rather than to the native antigen will be tested to better determine the response. However, since the goal is to get protective antibodies, it seems that the reponse to native antigen, which is what the animals will see in an actual infection, is what should be measured.

It is also important for the investigators to determine the nature of a protective immune response to *Y. pestis* infection before restricting their focus and undertaking such labor-intensive studies to define only B cell epitopes. Antibody reactivity does not assure protection, and with some pathogens high antibody titers have even been correlated with disease progression. In addition, non-F1 antigens may evoke a

COMBINED RECOMMENDATIONS AND CONCLUSIONS

The USAMRMC's program to develop a new subunit vaccine for pneumonic plague has been very productive and has made significant advances towards this objective. The leader and research team are highly skilled, competent investigators and, with continued support, it is anticipated that a new vaccine for human trials is only a few years away. The investigators have used very effective immunization and challenge protocols to test immunogens in both mice and nonhuman primates for protection against plague following either parenteral or aerosol exposures to *Yersinia pestis.* Having the facilities to safely execute aerosol transmission studies is a critical component of this program. The team has confirmed and extended the data supporting the potential for both recombinant F1 and V antigens to afford significant protection. The work using the F1-V antigen fusion protein is exciting and represents a significant advance made by this team.

The team has examined numerous other antigens for identifying additional protective immunogens, especially for challenge with strains of *Y. pestis* lacking the F1 antigen. For such isolates, the V antigen and possibly YopD are the only useful candidates identified to date. The addition of one more antigen would likely solve the problem of non-responders, as well as strengthen the response in all individuals. The choice of antigens being tested for potential vaccine components appears somewhat random. These studies could be focused better by determining what proteins induce an immune response, thereby demonstrating which determinants are most likely being seen by the immune system. Although it is not possible to predict in advance which antigens are protective, the search could have been directed more towards antigens known to induce an antibody response in infected human patients and laboratory infected animals. Additional focus on the basis of immunity to plague challenge is also recommended. The investigators are also aware of the immunosuppressive effects of V antigen, and plan to examine the mechanisms involved. These types of studies should allow the team to "fine tune" the V antigen to increase its efficacy and safety as a vaccine component.

The development of *in vitro* correlates of immunity should be a high priority of the program and is currently the weakest area of the future plans. As discussed with the investigators, the assumption that protection is solely mediated by antibody has potential difficulties. Before continuing studies to determine important B cell epitopes, the role of T cells needs to be addressed in collaboration with immunologists. There are standard methods, such as adoptive transfer, to determine if T cells protect against challenge with *Y. pestis.* There are also *in vitro* techniques to determine if T cells taken from an immunized animal proliferate in response to specific antigens. The studies using synthetic peptides have potential, but this work needs to be done with conjugated peptides. Alternatively, peptides could be attached to larger inert particles that could be taken up by B cells or macrophages that then present the antigen on class II MHC molecules on their surface. Epitope mapping of the F1 and V antigen peptides using immune sera from natural infections would have been an appropriate first step.

APPENDICES

APPENDIX 1: **AGENDA**

APPENDIX 2: **ABSTRACTS**

REVIEW OF PLAGUE RESEARCH PROGRAM

USAMRIID

15 FEBRUARY 1996

0815-0830 Welcome and introduction
COL David Franz, DVM, Ph.D.

0830-0900 Overview of Plague Program
COL Arthur M. Friedlander, M.D.

Treatment

0900-0930 Antibiotic treatment of experimental pneumonic plague
COL Russell Byrne, M.D.

Role of F1 Capsule in Pathogenesis and Immunity

0930-1000 Protective efficacy of active immunization with purified F1 from *Yersinia pestis* and an *Escherichia coli* recombinant strain against lethal parenteral and respiratory plague challenge
MAJ Gerard P. Andrews, Ph.D.

1000-1015 Coffee Break

1015-1100 F1 capsule is not a required virulence factor for the mouse or non-human primate
Patricia L. Worsham, Ph.D.
M. Louise Pitt, Ph.D.
LTC Kelly J. Davis, DVM

Role of Non-F1 Proteins in Pathogenesis and Immunity

1100-1130 Studies on the role of the pigmentation locus in the pathogenesis of *Y. pestis*
Patricia L. Worsham, Ph.D.

1130-1300 Lunch

1300-1320 Analysis of the role of pPst encoded genes in pathogenesis of infection by *Y. pestis*
Susan L. Welkos, Ph.D.

1320-1335 Plasminogen activator protease degrades proinflammatory cytokines
Allen Sample, Ph.D.

1335-1405 Cloning, expression, and protective efficacy of Yops and pH 6 antigen
MAJ Gerard Andrews, Ph.D.

1405-1420 Cloning, expression, and protective efficacy of V antigen
LTC George J. Anderson, Jr., Ph.D.

1420-1435 Cloning, expression, and protective efficacy of F1-V fusion protein
LTC George J. Anderson, Jr., Ph.D.

1435-1450 Determination of important B and T-lymphocyte epitopes in the F1 and V antigen proteins of *Y. pestis*
Jeffrey Pullen, Ph.D.

1450-1515 Overview of future plans
COL Arthur M. Friedlander, M.D.

Recombinant F1-V (rF1-V) Fusion Protein Protects against Lethal Wildtype Yersinia pestis in a Mouse Model

DAVID G. HEATH, GEORGE W. ANDERSON, JR., CHRISTOPHER BOLT, SUSAN L. WELKOS, PATRICIA L. WORSHAM, AND ARTHUR M. FRIEDLANDER
Bacteriology Division, U.S. Army Medical Research Institute of Infectious Diseases, Ft. Detrick, MD.

The virulence of F1- strains and their occurence in nature imply that F1 immunogen will not be sufficient for an optimal new plague vaccine. A fusion protein has the theoretical possibility of simplifying and reducing the cost of production of multiple antigens in addition to stabilizing the protein. For these reasons, we developed a fusion protein consisting of both the F1 and V antigens (1). The first fusion protein made consisted of F1 fused with residues 168-175 of the V antigen, a segment which previous studies suggested to contain a protective epitope. This fusion protein was used with the adjuvant alhydrogel (aluminum hydroxide) to immunize female Swiss Webster (Hsd:ND4) mice subcutaneously (s.c.) on days 0 and 30 followed by a s.c. or aerosol challenge with either the F1- C12 strain (LD50 = 9.1 CFU, s.c.; LD50 = 1.1 x 105 CFU, aerosol route) or the wild-type F1+ CO92 (LD50 = 1.9 CFU, s.c. route; 2.1 x 104 CFU, aerosol route) strain of Y. pestis. Endotoxin had been removed from the preparations prior to immunization, so that this would not be a confounding factor.

When 18.5 µg of the F1-V168-275 fusion protein was used to immunize mice, there was 90% survival (9/10) when challenged s.c. with 63 LD50 of the F1+ CO92 strain. The positive control was a group of mice immunized with 10 µg of rF1 which is equivalent to the F1 content of the F1-V168-275 protein. The rF1 control resulted in 100% (10/10) protection. The F1-ELISA IgG titers were the same (1:81920). All mice in alhydrogel control group died (0/9; MTD ± SD, 5.2 ± 1.0). When the F1-V168-275 immunized mice were challenged with 104 LD50 by the aerosol route, protection was 80% (8/10; MTD ± SD, 20.3 ± 7.1) compared to 0% for the control group (0/10; MTD ± SD, 3.1 ± 0.3; 80-104 LD50). The group immunized with rF1 resulted in 70% protection (7/10; MTD ± SD, 9.0 ± 1.0) when challenged with 80 LD50. The addition of part of the V protein onto the F1 protein did not appear to effect its antigenicity.

The F1- strain, C12, was used to test the ability of the partial V portion of the F1-V168-275 protein to protect mice against a lethal challenge. Here 27 µg of the F1-V168-275 fusion protein was used, which is equivalent to 10 µg of the V protein

known to be protective. A s.c. challenge dose of 55 LD50 resulted in 30% survival (3/10, MTD ± SD, 9.4 ± 7.0). All of the controls died (0/10, MTD ± SD, 10.8 ± 4.8). While there was some protection, there was no increase in the MTD. There was a good V-ELISA antibody response to the F1-V168-275 (1:163840). In case this response was not sufficient, another group was immunized with 27 µg, but with complete Freund's adjuvant (CFA). In this case, protection was only 20% (2/10, MTD ± SD, 9.1 ± 3.2), while 10 µg of rV in CFA resulted in 100% protection. The V-ELISA titer when CFA was used was 1:1310720 for F1-V168-275 and rV. A 10-fold increase in the V-antibody titer did not have any effect on protection and the V-ELISA titer was not indicative of protection. When a group of F1-V168-275 mice were challenged with 95 LD50, C12, by the aerosol route, no mice survived (0/10, MTD ± SD, 3.5 ± 0.5) All of the alhydrogel control group died (0/10, MTD ± SD, 3.4 ± 0.5). In other experiments, rV itself gave 80-90% protection against an aerosol challenge.

These results demonstrated the feasibility of making a F1-V fusion protein. The efficacy of F1 was not altered by making a fusion protein. However, while the V168-275 protein portion of the fusion protein was antigenic, it was not immunogenic. This caused us to address the question as to whether the entire V protein could be fused to F1 and whether it would be immunogenic.

Using a fusion protein which combines the whole F1 and the whole V protein (rF1-V) to immunize mice on days 0 and 30 increased the protection afforded by the V portion of the fusion protein. When 13.6 ug of rF1-V was used to immunize mice, there was 100% (10/10) protection against a s.c. challenge of 57 LD50 and 90% (9/10) protection against 1.1 x 106 LD50 C12 strain. Ten micrograms (10 µg) of rV also gave 90% (9/10) protection against 1.1 x 106 LD50, C12 strain. All of the alhydrogel control group died (0/10, MTD ± SD, 6.0 ± 0.0). The rF1-V protein also offered protection against an aerosol challenge. The same immunization schedule resulted in 100% (10/10) when mice were challenge with 546-636 LD50, C12 strain on day 73 postimmunization. When mice immunized with the rF1-V fusion protein were challenged with 762 LD50 of the F1+, CO92 strain by the aerosol route, 100% (10/10) of the mice survived. The F1-V fusion protein was able to protect mice from a significant aerosol challenge from either a F1+ or F1- lethal strain of Y. pestis. This protection is better than the protection afforded by the current Plague Vaccine USP. When mice which were immunized on day 0 and 30 with 0.2 ml of the current vaccine and challenge by the aerosol route on day 73 postimmunization with 546-636 LD50, C12 strain, all of the mice died (0/8, MTD ± SD, 3.3 ± 0.5). The V-ELISA titer to the Plague

Vaccine USP was <1:640.

The recombinant rF1-V fusion protein was produced in E. coli and contained a polyhistidine tag which aids in the purification of the fusion protein. While this protein has been shown to be highly efficacious in the mouse model, it remains to be seen whether this level of protection will be seen the in the non-human primate model. Further, the regulatory issue of whether a histidine tagged protein will be acceptable to the Food and Drug Administration needs to be resolved.
